Hello Dan,  
thanks for the advice – but it doesn't work. Here the steps I make:

**PART1:**

I have ha GRID on a form set to visible=.f.  
I open a table TESTTABLE  
I bind the GRID to the table with GRID1.RECORDSOURCE= "TESTTABLE"  
and make the GRID visible.  
Now I have a little routine in GRID1 -> COLUMN2 -> TEXT1 -> CLICK  
THIS CLICKEVENT ROUTINE NOW WORKS FINE

**PART2:**

next I tell the the GRID that the RECORDSOURCE is "" with  
GRID1.RECORDSOURCE=""  
now I close the table with CLOSE DATABASE

**PART3:**

I do the things described in PART1 again and the CLICKEVENT doesn't do  
anything anymore and I have the question: WHAT WENT WRONG?

Greetings Gerhard

The event still fires, but your code is gone because you've closed the  
grid's data source. When you do that, the grid deconstructs.

Set the recordsource to "" before closing the table. Or, better yet, don't  
close it. <g>

Hello Friends,  
now I started using a GRID. It has two columns and uses as

## Re: GRID Click Event Fires Only Once

RECORDSOURCE a DBF table. With a click i can change a .T. to .F. and back again. Everything works fine until I close the table and make the GRID invisible. Starting everything again the same way brings back the GRID, but the ability to fire an EVENT (such like a CLICK or a RIGHTCLICK) is not possible anymore – it's gone...  
CAN ANYBODY TELL ME WHY?

Greetings Gerhard
