After automatic antivirus update saving from PC running under OS WinXP on server running under OS Linux slows down rapidly. Operation that used to need 10sec need sometimes 1min (but this time is variable).

There is a shared folder on linux server there is a that is mapped on PC  
The application writes into DBF tables as well as it creates a new files on server

Simple saving (using Explorer) from WinXP on Linux server is normal

If I unistall antivirus this problems remains

If I restore system WinXp back application runs normaly up to update uf antivirus

Application that runs on Win98 works normaly

Does anybody help me how to fix this problem ?

Martin
