Edhy,

I agree on the maintaining part. Each installation is different. In my case I went with mapping for the reason that I have been adding and changing this program for over 7 years. Each time the users run this program they find the need for an addition, modification, change the spelling, add another field, add something to the report add another report. If I did not load the application on the server I would have to be installing this program almost weekly on 12 machines. The way it is now I make the change at home, link into the server with gotomypc and upload the program to the server and I am done.

Hi Cy,

You are right, but not in all scenarios, when having less than 10 users, the ..EXE size is not really big and the network is properly setup with good workstations, I see no performance hit on the server or the application.

All my applications are installed on a network share folder (mapped) and so far have not received any complains. One project I was working long time ago with VFP6 I had to go with the loader because the .EXE was over 25MB and it was really noticeable, but in must cases it will work just fine from the network share and it is easier to install and maintain.
