Good day all,

I am developing a personnel access control app and I do not want to rely on system time to record the events, I rather prefer to read time from an Internet server at application initialization. Users are able to change datetime on their computers, this is a requirement some times to operate another app so I can not block access to the system clock.

Does somebody know about an Internet Time Server, how to access it and obtain the time? Some code sample would be great !

Thank you in advance for your help.

Sincerely,
Carlos Jones.
