If order is set to 0 and no filter is set (not even DELETED) and the active row is in the visible part, you could do some calculations with .height, .rowheight, .headerheight, .activerow, .relativerow and others to find it. But if a filter is set or an order, then I don't see a reasonable way.

The grid does not disclose such secrets.

I would expect a method to do this... Basically, a way to access each visible cell's controlsources by actual rows and columns of the grid.

Foxpro 10? :)

If you scrolled vertically with the mouse, the active row can get out of the visible part of the grid!

Forgot this one.. Thanks. :0
