One of my clients just got a new Vista machine. VFP-based application is on Vista machine. But it s very slow to access dbf files on the server from Vista machine. But it s very quick from XP machines. Any ideas? TIA.

What are the specs of the Vista machine? I am running Vista on both my personal laptop and my Desktop work computer (32 and 64 bit version respectively) and while it's a little slower (for some things more than others) Vista is slower with the same hardware specs VS XP. I have 1GB RAM on both computers with 2.8 Ghz processors on both. For network stuff, I find it seems to be about 10% slower, but for local stuff, currently I find about 50% slower, I expect that to change when I upgrade the RAM in both cases to 2GB in the near future, as the OS takes about double the resources itself compared to XP. I would recommend 1GB RAM minimum rather than the 512 MS states.
