Hello and thanks in advance for the help...

I have a grid control which is based on a small table that is extracted from a larger table. When the user scrolls to the last row, I would like to be able to query and show the next (or previous if the user scroll up from the first record) batch of records.

How do you detect all of the various method (Keyboard, Scroll Bars, Etc.) that the user might be using to scroll up from the top or down from the bottom.

I could put menu items on the menu to query but it would be more natural if they could just work in the grid.

Thanks,
Jeff
