Hai Roy,

There are a few ways to store a picture in a foxpro database, normally a general field is used for that pupose.

(Store the picture with APPEND GENERAL mygenfield FROM C:\WANTIT.BMP)

Use an "ole container" to display/print it in a form / report.

But there are a few downsites of a picture in a general field which depends on the software installed on the client machine. So an other way is to store it in a binary memo field.

See this sample code:

```
CREATE CURSOR GENDBF (FileName c(150), MemBin M NOCPTRANS)
INSERT INTO GENDBF VALUES ;
("levejane.bmp", FILETOSTR(HOME() +
"Samples\Tastrade\Bitmaps\levejane.bmp"))
INSERT INTO GENDBF VALUES ;
("pattcaro.bmp", FILETOSTR(HOME() +
"Samples\Tastrade\Bitmaps\pattcaro.bmp"))
INSERT INTO GENDBF VALUES ;
("peacmarg.bmp", FILETOSTR(HOME() +
"Samples\Tastrade\Bitmaps\peacmarg.bmp"))
INSERT INTO GENDBF VALUES ;
("perelaur.bmp", FILETOSTR(HOME() +
"Samples\Tastrade\Bitmaps\perelaur.bmp"))
INSERT INTO GENDBF VALUES ;
("smittim.bmp", FILETOSTR(HOME() +
"Samples\Tastrade\Bitmaps\smittim.bmp"))
GO TOP
```

```
PUBLIC oform1
```

```
oform1=NEWOBJECT("form1")
oform1.SHOW
RETURN
```

\*\*\*\*\*

```
DEFINE CLASS form1 AS FORM
```

```
TOP = 71
```

```
LEFT = 48
```

```
HEIGHT = 310
```

```
WIDTH = 504
```

```
CAPTION = "Fox Image Demo"
```

```
NAME = "Form1"
```

```
ADD OBJECT image1 AS IMAGE WITH ;
```

```
