I'm pretty sure it does but I think I will go the way of recording the live programming and adding a link to listen to the previous days broadcasting. Sounds much easier and less hassel.
Thanks Andrew

Does your broadcast licence cover net-casting? I assume that licencing such is an issue here.....but that's on the side and not the point of your post.

Thank you Andrew.
I still might look into live feed. It does sound a lot more complicated but we have the technology to handle. I would consider myself an intermediate and somewhat limited in my know how, but am also a very quick study and love to expand my knowledge.

I don't know that live streaming on the net would be that easy to do (for those with limited know-how).

However, if you were to record a show during radio broadcast, and then make it available on the net at a later time, then the procedure below will help, as it outlines how to stream prerecorded audio (Real Media format) :

Re: Adding a radio link?

Can I serve RealAudio/RealVideo files from my web site?

Yes you can. Unless you want to live broadcast a TV or radio station, pre-recorded RealAudio or RealVideo is just like any other file. In fact, in recent versions you can "stream" the media (that is, it starts playing as soon as you click the link, rather than when the file has finished downloading) without any special servers.

To do this, you need to create an additional file to accompany the encoded RealMedia file. For example, if your username is billybob, and you have a file called wedding.rm that you want on your website, place the file in your web directory, and then create a supplemental file called wedding.ram. In the ram file, put the complete address to the actual file, like this:

<http://www.iinet.net.au/~billybob/wedding.rm>

Now, if you link to wedding.rm, it will play wedding.rm in your RealPlayer program.

The reason two files are required is the the "ram" file will pass the responsibility to download the file to your RealPlayer plugin or program – which then knows how to stream the file live. If you just go to the content directly, your browser will download the entire file first, before passing it over to the Realplayer.

[from www.iinet.net.au]

The live net-casting sounds a lot more involved, requiring high-end computer server(s), appropriate connection and bandwidth to cope with the demand (eg DSL or better) even if it is a small target audience such as your church congregation) and a whole lot of other complicated stuff.

Please forgive if this is not the right group.
I have created a web for my church using
frontpage 2002, not yet
published,
and would like to add a link to our radio
station which is located in
our
church basement. It's a low power fm
station. Is it possible to add a
link
so
someone can listen to our radio feed?? If so,
how????
Thank you for any input.
