After reading so many postings regarding missing navbar items, I spent several hours working on this very issue.

Although there are many ideas and excellent posts regarding this very issue. I began to get frustrated. I've always believed that 'Recalcing' a web site was a great idea, but for the long term it made no sense.

Here is what I employed (okay – mostly accidental), but the idea came from a client that recently had a web server crash and we restored his web site (of course we did the 'check file dates/time' thingy etc.)

- 1) Delete the structure.cnf file from your Web's _vti_pvt folder on the Web server (thanks to Microsoft for this one),
- 2) Republish your Web to the server:
 - 2.a) Start FrontPage, and then open your Web,
 - 2.b) Click Publish Web on the File menu (or use the gui button),
 - 2.c) In the Publish Web dialog box, type the path of your Web server.
For example, type the following:
<http://MyWebServer/MyWeb> or if you have DNS setup enter your web address like: <http://www.bob.com>
 - 2.d) Click the Options Tab to expand the list of options, and then click Publish all pages,
 - 2.e) Click on OVERWRITE any files already on the destination. VERY IMPORTANT!!!
 - 2.f) Click Publish.

All SHOULD be well.

I truly hope this helps severyone. It actually REALLY did fix my problems.

R :)
