If there is no database involved there should not be any problems, provided the desktop can cope with the combined load of publishing and visitors – find a quiet time to publish.

Any database may present problems, especially if it updated by visitors. In this case you may have to disable the active pages, publish the database, then restart. However, any updates on the old database from then onwards will not be added to the new. It can take up to three days for DNS to be updated, though on an intranet DNS updates could be instant.
