When I check the Computer Management ->Shared folders -> Sessions screen, it displays the active users who connected to server. User name should be windows userid from the client machine, but it displays another userid that is created for intranet account, for the same client workstation. Same user tried on the different machine, and everything was normal. Problem is related to specific client workstations, who signed intranet with intranet userid and try to work on their shared folders with windows networking.

As if there is miscommunication between client and windows 2003 server. We have firewall in the building and server and clients are behind the firewall. On the sessions screen computers external ip was displayed instead of computer name.

I know this group is not windows group, and asked same question but have not gotten response yet.

thanks for help
