I've recently put 2003 Advanced Server on a machine that previously had Windows XP Pro. This machine hosts my web site which I normally create on another machine using FrontPage 2003. I was able to edit on my work machine and deploy to the 2003 Advanced Server and the web site works just like it used to. Almost anyway.

One exception is the Feedback page. There appear to be some sort of permissions that I need to set on the server but I don't know what they would be or where to set them required in order to permit this form to collect its information and email them to a specified address. This is a standard Feedback page except that I've specified that it send the user's feedback via email. This was done with the standard FrontPage method of right clicking on the page, selecting Page Properties, selecting 'Send to' and specifying the email address that the form's contents are to be sent.

When a user tries to submit feedback, he initially gets a logon dialog box. If the user specifies a value username and password then an error of some sort happens and he gets a page with

"Cannot run the FrontPage Server Extensions on this page:

<http://www.haggard-and-associates.com/feedback.htm>

on it. What do I have to do to permit email of the feedback form to work again?
