I understand there have been many posts already on the subject so my apologies for not understanding. I am running Windows Server 2003 with FPSE2002 version 5.0.2.6738. The server is an HP ProLiant DL360 G4 with 2 Intel Xeon 3.0 GHz/800MHz -1MB L2 processors.

I use FrontPage 2003 client software. We have intentionally chosen to allow management of the pages using Server Based hosting (no publishing). As myself, I have no issues updating a web page by simply clicking File --> Edit in FrontPage. I am able to save without issue. I want to allow others to be able to publish also. I give them every single permission I can find using the FrontPage Site Administration for that subweb. Users are still unable to edit the pages using FrontPage on their PCs.

Can I use FrontPage for this or is it no longer supported? If not supported, where can I find a recommendation for setting up security on the website to control who can edit vs. who can browse?

.
