No, sharepoint does not need to be installed.

One thought – if your web is in a Virtual folder then that may be why the extensions do not work. The folder has to be *in* the default web (as a subweb) for it to appear as a folder in the default web. To avoid using a subweb set up a virtual server, not a virtual folder.

- I forgot to mention:
- Server Extensions are 'Allowed'
 - I also tried to 'Allow' all of those available
 - I also restarted the server after each change
 - Server roles: File, Application (NOT MAIL, I point to my Internet connection's SMTP server)

However, I do NOT believe that I have SharePoint installed (unless I chose by accident). Does this have to be installed?

I will also try to move my web. I've had bad luck when I have tried to move it out of the Default web.

Thanks in advance,
–Adam

Windows Server 2003 is a locked down environment, and, for websites, everything you use has to be enabled first.

Re: Server Extensions Administrator

On the server, open IIS MMC (Start->Administrative Tools->Internet Information Services (IIS) Manager) and expand the folder tree. Open the folder Web Service Extensions, and ensure that FrontPage Server Extensions is allowed. If not, click on the item and click the Allow button. (You may have to click the Extended tag to see the Allow button.) Close IIS MMC.

Start->Administrative Tools->Microsoft Sharepoint Administrator
The opening page gives a list of all websites on the server, check that your site is on the list, and it has either Extend or Administration link. If the link is Extend, then server extensions have not been installed – click Extend to install the extensions.

If there is a version number for your web starting with 6.x, then you have a Sharepoint Services web, not a FrontPage Extensions web. Otherwise, click Administration.
On the next page, click Go to Administration for websitename, login if necessary.
Scroll down to Server Health, and run Check Server Health, and allow all checks and repairs.

This should correct whatever is wrong. It is possible that opening the web as a disc based web has corrupted part of the extensions.

FYI, on Windows 2003, I never use the default web, always leaving it as set by Windows IIS installation, and create virtual servers for all my sites.

A rough guide to setting up the SMTP server and configuring extensions for SMTP can be found at www.rxs-enterprises.org/fp/b/smtp/
Note: where you see click on Virtual Servers -> Default web site Administration click on your own website instead of the Default web site.

Ron,
I can't seem to post a new question, so I'll try a reply here.
– Win2003 Server w/ FP2003 and 2002 Extensions installed

Re: Server Extensions Administrator

– Email set up through administration appears to be set.
(correctly
??)
– 'thisweb' is set up as a virtual web under default web
– I do get the component error message in FP2003
I'm also getting this problem, and I can't get it to go away.
I've
always
opened as 'disc based', pointing to c:\web\thisweb. Your
response
indicates
that this is an incorrect way if I want to test my forms. For
kicks
I tried
to open <http://machinename/thisweb>, but it failed as not
found.
Am I just simply missing something obvious or is it
something
else?
Thanks in advance for any assistance.

A server based web is one you open using an
<http://> address,
such
as
<http://www.example.com>

A disc based web is one you open in
FrontPage using a file
system
location, such as e:\mywebs\webname.
This is still a disc based web even if it is
used by the web
server
as
the source of the finished website.

You can build webs in FrontPage using
either system, but for
testing
(or running the web) you must be using a
server based web if the
site
includes any FrontPage run time
components, such as hit counter,
guestbook, discussion web, custom linkbars,
forms (that use the

Re: Server Extensions Administrator

extensions as a form handler).
Also, any web that uses run-time
components must either be
built/edited on a server (using the http://
address to open the
web
in
FrontPage) or published to the server using
http publishing, not
FTP.

You will have to configure the extensions
for SMTP since you
have a
form in the web that sends data through
email.

Thanks Tom, Ronx for the
feed back

I normally play with
dreamweaver, this PC dont
have it and the
site
was put
together in Frontpage. I am
not fimilliar with the whole
set
up,
when u say
disc based I am not sure, do
i have to configure the FP
extensions
for an
smtp or ???.

As I say i am not to fimilliar
with front page and I'm
learning

Re: Server Extensions Administrator

Thanks,
different
interface
lets
see
if
it
works.

The
reason
being
is
that
i
want
to
use
the
basic
mail
function
in
the
form,right
click
on
form
and
send
file
through
to
email
address
and
so
forth,
its
just
that
if
i
try
on
this
pc
i
get
the
error
