Yes, you can open the site in FP2003, but you don't see all of the files/folders. Open the site via WebDAV (Dreamweaver or Webdav folder) and you see everything.

Since it was a large site, with many subsites, the FP 2003 publish would throw up seemingly random errors on different files. So we had to use WebDAV and FTP to copy some of the files over.

Could performing a copy of one of the "_" folder contents from the old to the new server be causing the problem? I've run a Check Server Health, Detect and Repair. Any other command to try? Maybe a command line of the owsadm utility?

Thanks

Can you open the site directly in FP via http? Some file and folders will

never been seen in FP, as they are hidden FP extensions files.

Also _vti folders are never published or copied between servers / locations as they are unique to the installation of the FP extensions on a specific server and the specific web site created and managed by FP extensions.
