Hi Thomas

Thanks for your time, i will check on the places you suggested.

Hi again,

Well i am using hostheaders and have done this aproach for several years and it have never been any issue before, but on the other hand i dont really like FPSE so in all other enviornments its not installed. But in this special case it have to be installed in a hosted enviornment looking like this. Its not a new problem that i have but an old on, but having posted on diffrent forums and such and have not found any solution or explanation on why it should not work i thought i would go to where all the pros are :)

Regarding your FYI, that would be the best aproach in meny cases not in this in my opinion as there actually can be more than 253 sites on this and probably is, if we count the diffrent hostheader sites. And besides this issue all iis/users/ftp/fpse and such are scripted so in that case i would aswell need

Re: Multiple FP sites with same rootfolder

to keep a sync on ip's between the servers that could not be in the same subnet... ohh well its a bit complicated :)

Shortly, hostheaders is the only acceptable way of doing this and other aproaches would be a waste of IP's.

Ohh well, back to the problem.

What i have been able to find out is that if i login with the Administrator account on the second web i create, it works fine... Any clue why that is?

I am really bad @ FPSE so please forgive me if i miss something really basic first starter stuff.

Cheers
Tiru

If you want to use host header, then you might be able to do so, as long as your create individual folders/subwebs/subsites for each domain, and then point the host header to that folder. From within FP you would always open the root web via the primary domain or IP Address.

FYI: Individual IP addresses would be the best approach.

Hi Thomas,

As we have alot off different sites (50-200) we need to use host headers, or how do you mean that setup should look like? We cannot have a own ip for the diffrent webs so in my experience the only way to do this is to use host

Re: Multiple FP sites with same rootfolder

headers.

What should be and was in the beginning was that the difrent sites had multiple host headers on them. Now thats not possible anymore and the need to make a new "website" pointed to the same root was the way to go each time a new hostheader (dns-name) should answer for a old site.

/Tiru

Don't use host headers, as the FP extensions do not work well with them. Use DNS to point multiple domains to the same web or use ASP / ASP.net.
