I performed a move of my large site from a Windows Server 2000 machine to a new Windows Server 2003 box. After doing so, when connecting to the site via FrontPage and attempting to access subwebs, I receive the following message:

The page cannot be found

The page cannot be found The page you are looking for might have been removed, had its name changed, or is temporarily unavailable. Please try the following: Make sure that the Web site address displayed in the address bar of your browser is spelled and formatted correctly. If you reached this page by clicking a link, contact the Web site administrator to alert them that the link is incorrectly formatted. Click the Back button to try another link. HTTP Error 404 – File or directory not found. Internet Information Services (IIS) Technical Information (for support personnel) Go to Microsoft Product Support Services and perform a title search for the words HTTP and 404. Open IIS Help, which is accessible in IIS Manager (inetmgr), and search for topics titled Web Site Setup, Common Administrative Tasks, and About Custom Error Messages.

On the previous machine, the site was located at D:\Inetpub\wwwroot. On the new site, we've located it at D:\Intranet. Could this be the source of the issue?

Any help is greatly appreciated! I'm so stuck!
