If you truly encrypt, you'd have to have something on the client to decrypt. There are a lot of people who *claim* to encrypt when really all they are doing is encoding. The two are most certainly not the same.

Once again, I point you to my site where I demonstrate this.

> Hey Steve, it can be done. Encryption will make it much harder for anyone to understand your source code. There are a bunch of sites on the internet that offere this service free. I also will be launch a "PowerTools" site to allow this to be done. It is currently the only way I can think of actually hiding the source. And if you are so worried, place some copyright tags down at the bottom and if they "borrow" any material, sue them. ;-)
