This is what I am trying to accomplish:

I have several layers that I have turned into "buttons", meaning when a user clicks the "button" a corresponding page will open based on an ASP script.

I have given each Layer a unique ID so I can "hopefully" pass that ID to my ASP script.

The page that I want to open is based on criteria that will be passed to the asp page via the layer id.

My question, how can I pass the Layer ID to an ASP Script?

"Kevin Spencer" <kspencer@takempis.com> wrote in message news:uS1NqSePEHA.3300@TK2MSFTNGP09.phx.gbl...

> *Your question doesn't make sense as stated. A layer is an HTML div. Like any other HTML element, it can have an ID attribute. However, it is simply an HTML element in your document. As such, the rest of your question becomes meaningless. How about telling us what you're trying to achieve with this (with regards to the end user experience), and we can suggest some solutions.*
