Okay, it only took me 10 minutes to find the applet (it would have helped if you had posted the correct URL). It works.

Don't know what good you expect to gain from this question, though. You might just as well ask if an Access mdb file opens fine on anyone's machine. Those that have the Access program will find that it opens fine. Those that don't won't. In your case, those that have the JVM installed on their machine will find it works. Those that don't won't.

Therefore, if your aim is to have something that works in all browsers, don't use a Java applet. Which brings me back to my first answer.
