For the very first time, I can see the default page of the web datamanagement.

I am still learning how to use it, but it works just exactly as you said, created a virtual directory and pointed to the sources of files and it has done.

No, it did not create a virtual directory for me, and I wonder why. Now I know how to makes it work and maybe I shall remove and reinstall it again to see if such VD will be created.

Many many thanks to you.
