My ISP has an upload component for an http upload (AspUpload). Took 'em about 15 minutes to configure it for me, and it took me maybe 45 minutes to write a page, and get it working. Check with yours. Check with your company admin to see if they will buy an upload component. If not have em set you up a write enabled directory, then Google for upload scripts. How do you access the internet from a client's shop now? If they let you hook up a laptop, you're home free, but I'd bet not. GL!

Thank you, that was essentially what I did but that was intended only as a stop gap measure. The problem is, my connection from my FrontPage client to my own company's web server is through a cell phone modem. Transferring a 50 megabyte file via cell phone modem is somewhat time consuming. What I want to do is to transfer from a client company computer across their own internet connections to my own company's web server. I was hoping for some sort of upload technique that didn't involve updating a sub web from my FrontPage client across its very slow cell modem connection to the internet.

So - how do I set up my web page to catch a file upload from an external computer across the internet?
