## Confirmation Page...

On your new page, type the text you want to display to a site visitor who has submitted the form.

For example, "Thank you for your response. Please confirm your e-mail address."

On the page that contains your form, identify the form field data that you want your site visitors to confirm. For example, you could display the contents of an e-mail address field, allowing the site visitor to confirm that he or she typed it correctly.

You will need to use the unique form field names for each data field you want to send to the confirmation page.

From your confirmation page, type the name of the field from which you want to display information.

How?

On your confirmation page, from the Insert menu, click Web Component. In the Component type pane, click "Advanced Controls", and in the Choose a control pane, double-click "Confirmation Field".

Type the name of the field from which you want to display information, and then click OK.

Note: The name of this field must match the name you gave the form field when you set its properties.

The name of the field is displayed in brackets [ ] on the form. When the confirmation form is displayed to the site visitor, this field will display the site visitor's entry instead.

Repeat the above steps for each field you want to display for confirmation.

Assign the confirmation page to your form.

Re: confirmation field

How?

Open the page containing your form by double-clicking the file in the Folder List.

If the Folder List is hidden, on the View menu, click Folder List.

Right-click the form, and then click Form Properties.

Click Options, and then click the Confirmation Page tab.

In the URL of confirmation page box, type the file name and location of the confirmation page you just created, or click

Browse to locate it.

Notes:

If you are saving your form results to a database, you must save your confirmation page with an .asp extension.
