Hi Ronx

I have tried that and just awaiting results from the tracking company...but as you say the problem lies in the statement between the no script tags

I must admit that I dont fully understand the tracking script..but if I am filling the variable wgOrderReference is this variable actually used to transmit the data?

or is the data transferred by the statement between the noscript tags? I know that the tag [Email] will be subsituted by the clients email address..so why not in the following statement? How can I get the clients email address into this statement (knowing I have it stored in [Email] and my hidden form field ClientEmail??

If as you say I need server scripting then how would I do this???.confuded even more now??

```
</script>
<noscript>

</noscript>
```

```
Try
var wgOrderReference = document.getElementById('ClientEmail').value
```

Your <noscript> will always fail unless you use server side scripting, because getting the image from a .html page using a querystring requires JavaScript – and JavaScript is not available if a <noscript> tag is

Hi all

I am back again and really really need your help

I asked a question a few days back, I needed to have the contents of a forms email field available on the confirmation page to be assigned to a javascript variable contained in some javascript tracking code in the body of the confirmation page.

I was told that the MS Frontpage std forms component would not let me do this..so ok I went and purchased send it.from Webs Unlimited (a custom form to email script) and have it all working with my front page web but I just cannot get it to do what I purchased it for (even with the limited help of webs unlimited???)

Basically on the confirmation page if I put a [Email] tag then this is substituted for the email address that was on the form..standard stuff no surprises here.

Then the fun begins.....

If I have this code in the body I can get the email address into the field id ClientEmail and display it (although this would be hidden in live

web)

```
<form name=idform/>  
<input id='ClientEmail' name='ClientEmail' type='text' value=[Email]>  
</form>
```

So I thought..ok.. if I can get the contents of [Email] then I should be able to assign it to a javascript variable..so I tried `var wgOrderReference = '[Email]'`; as suggested by webs unlimited but it does not work.. the tracking company just receive a value of [Email] for that

Re: Help–Need confirmation page email address to be assigned to a javascript variable – Stuck again

Re: Help–Need confirmation page email address to be assigned to a javascript variable – Stuck again

variable????

so I tried `var wgOrderReference = document.getElementById('ClientEmail')`
thinking this should do it as I know it is in this field because I just
put
it there...well that does not work either???

I also need to make sure that the email address is available here
aswell..but that does not work...

```
</script>  
<noscript>  
  
</noscript>
````

Anyways I am not hot on web programming and this has really confused me.

So.. anyone ..please can you have a look at
<http://www.metrofinance.co.uk/mortgageenqtest.htm> and the confirmation
page
generated and let me know where I have gone completely and utterly
wrong:-))

If anyone can help..I need some code examples and where to put them..my
brain has now lost the will to live in trying to sort this out..probably
dead simple for one of you gurus (I hope:-)

If you need any more info please just ask

cheers

Ed
