Either way he would have to manually add the include component or tag to each page, there after he would only have to update a single page.

My existing site was created with frame. I would like to stop using frame and put on my main frame a navigation menu on the top. I would like to know if there is an automatic way to copy this menu accross my entire site without me going to every page one by one and paste the menu? I look into dynamic web page template but it looks like it reformat my page a remove background...  
Thanks for your help

You can put the code in another file and use the FrontPage include on each page. When you save the page and exit FP, the included file is added to the code.

OR, if your web server supports it, use a ServerSide Include (SSI)  
e.g.  
<!--#include file="\_fpclass/fpdblib.inc"-->

With the SSI, the included file is included when the page is accessed on the server. Only the code itself should be in the included file.

Re: Is there an easy way to update all the page of my site?

Re: Is there an easy way to update all the page of my site?

If memory serves me right, the FP include includes all the code in the <body> of the included file.
