I would like to have a website with a box showing a layout of a simple facility, and of the same size facility have another aisle layout. For example on the website there would be two boxes, each with "aisles". This will represent the layout of a warehouse.

Now that we have the layouts, I would like the user to select the amount of random points to be generated on each layout.

Next I want the random points to show up on the layouts, and from a point, (it will be the bottom center) of each box, have a worker go to each random point and return to the point. This needs to be shown graphically.

I would like a timer so each layout can be compared to each other. Basically a race between the two layouts. The user could then see which layout was more efficient.

I am a decent programmer in VBA-Excel and I was wondering what would be my options to do this, meaning what software, etc do I need. Is this possible in frontpage? Do I need to know java? Does this need flash? I am not sure where to start.

.
