You do realize that: that is an automatic function in FrontPage??
If you rename any file or folder when in folder view, you will be prompted to allow FP to update all links that contain that file or folder name.
(Providing that the links are "Not" contained in a javascript link)

Good morning,

I'm going to have to begin renaming the file structure of a website that is comprised of a dozen sub-webs. I need to ensure that links and src attributes are updated when I rename a directory or file name. I am able to save all links and src attributes throughout the entire website to a database, and I would like to create a Frontpage add-in that would fire when a folder or file name is renamed, scan the database for associated links, and then update any pages with inbound links or src's.

The part I'm stuck on is I don't know how to trap for an event when a folder or file is renamed. Is there an event available for this purpose? Is there comprehensive documentation about the Frontpage document model and how to use it somewhere? I'm having a hard time tracking any good information down...

Re: Update links outside a subweb when a file or folder is renamed with Add-in

Many thanks,

Chris
