When you edit a record, you are writing the same record back under the same ID (key) with updated info.

You have to load the record into an Add-Record form, which then inserts the updated record as a new record in the same or another table in the same or different database within the site. This is something that the FP database component is not designed to handle, so it must be a hand coded solution.

The Frontpage 2003 Database Wizard (DBW) creates an "edit" option. It allows you to select a record and edit a field. Then it rewrites the modified record back under the same key. I need to have a different (new) key – have it added as a new record set.

Unless you are actually changing and saving an existing record back to the same table, you are not editing the record.

In order to accomplish what you want, which is to load an existing record into Add Record Form, which would then allow the current record to be modified and submitted to

Re: Editing and saving DB entry with new ID (index) number

another table, may
require hand coding.

I need to edit an entry in an access database and then save it
as a new
record. I have designed everything with DBW. The
update.asp file gets the
edited info and writes it back in the same record.
Submission_Form.asp
writes a new record. I can't figure out how to utilize the code
in
Submission_Form.asp to save the output of update.asp. It is a
huge hunk of
code but I can post it if needed. I created the website with FP
2003.
