Ron Symonds (one "m") and Ronx are the same person. :)

FrontPage extensions are found by:

Control Panel->Add/Remove Programs
Click Add/Remove Windows Components
Click Application Server
Click Details button
Click Internet Information Service (IIS)
Click Details
Tick FrontPage 2002 Server Extensions
Click OK, Click OK, Click Next

You will need disc one for the Operating System.

Next step is to create a new website or two. This will require that the server is bound to multiple IP addresses – one extra IP address for each new website. To set this up you need
Control Panel->Network Connections-Local NetWork->Properties
Internet Protocol (TCP/IP)
Properties
Advanced
Add
Fill in the form
Click OKs to clear the dialogues and restart the computer.

Create folders for the websites.

Use IIS MMC to create the websites.

Extend the websites using

Control Panel->Administrative Tools->SharePoint Administration Manager

Some advice for this is at <http://www.rxs-enterprises.org/fp/b/smtp> – this is not the complete handbook, but may get you going.

Do not confuse the above with SharePoint Central Administration, which is for SharePoint sites.

"sangara enterprises ltd." <sangaraenterprisesltd@xxxxxxxxxxxxxxxxxxxxxxxxxxxx> wrote in message <news:15CB3670-F734-4F9C-9A7D-199858FCADE8@xxxxxxxxxxxxxx>:

It took some time to assemble an accurate overview of our exchanges so as to attempt a feasible action plan. Double teaming two Ron(s) added an extra bit of muddle, as did the information interchange timings, but was able to achieve a satisfactorily informative outcome using the old wasteful hard copy paper/cut and paste methodology.

What I get is: Ron Symmonds advises first installing Server Extensions to be found on my Windows OS CD. Then there is the creation of new IIS Websites preliminary to publishing Front Page content websites to these receptacles. To clarify what is on this box: Small Business Server 2003 Standard R2 OS – to which I have an effectively upgraded to Premium Edition as already in possession of Front Page 2003 and SQL Server 2005 [with SP2]. Where exactly are these extensions? Disk One gives me the option to install the OS but no partial option is apparent; and the Technologies CD also provides no such option. BTW thank you for your efforts to clarify other technical relationships between the IIS server function and Front Page interface as well as the real relevance of using template web sites.

Question: How and where do I go to install the Extensions from where among my OS CDs?

RonX [also referred to as Thomas? by Ron Symmonds] have tried to go through Control PanelàAdd/Remove ProgramsàWindows Components. There is no 'option' choice presented under IIS here, IIS itself is not displayed as a separate component among the 15 shown. Does it form part of another component, and if so which one and what's the protocol involved to get the job done?

Guys, appreciate your help to get the foundations in place properly before attempting the next step of setting up the IIS Server enabled web site together. This is stage one. Only after these developmental aspects are under control can my attention advance to shift on to Sharepoint Services. It is imperative these technical aspects get in place so my actual operational projects can finally get started.
