My provider only allows ASP to connect to SQL Server. They give a sample script. I've made a form to input data. Where do I put code for the

script?

On the the same page as the Form? Also, What do I put in the option box

for

the send to box?

Thanks in Advance.

Do you know anything about Html? Seems to me I have a list of "Things I wish I had known before I started using FrontPage...." The list is both funny and rather sobering.

You do put the file name of the ASP script in the input Form. I assume the sample script takes the information from the Form, connects to the Sql server, retrieves the data and then formats it and has the IIS server send it back to the user.

If you have setup your FrontPage on a Windows 2000 Professional workstation or an XP Professional workstation you can can install IIS (Internet Information Server) on that workstation and then use the database wizard to generate samples of what you want. It will then demonstrate how you want to stich the html and asp files to do what you want. Oh, yes. The asp code needs to be saved in a file that has an extension of .ASP just like an ordinary html page needs to have the extension of .HTM

I just check my notes. Get article 287993 from the Microsoft Knowlege-base at Microsoft.com It should give you some idea of what your trying to do and cross reference you into a couple of other useful articles.

Re: Using ASP script to connect to SQL Server

If no one else chimes in with more useful information in a couple of days, I suggest you re-post the question in the "other" newsgroup, the one that ends in: .client it is VERY active and has several Microsoft VIP's in FrontPage reading and posting on it.

Thanks,  
Tom Miller
