Welcher (vorzugsweise kostenlose)  
Virens Scanner ist für Vista zu  
empfehlen?

PlaceboAV. Gibt es kostenlos unter  
<<http://www.doxdesk.com/updates/2008.html#u20080129-av>>  
mit  
ausführlicher Anleitung.

Optimal – wird aber leider nicht anerkannt vom Sicherheitscenter.

Ach so. Ich dachte, genau das würde passieren.

Leider nicht, weder unter VISTA, noch unter XP.

Ist denn in Vista eine Liste mit "zulässigen" Programme eingebaut,  
oder kann sich ein Programm selbst im Sicherheitscenter  
registrieren?

Beides ist möglich.

| Q: How does Windows Security Center detect third-party products  
| and their status?

| A: In Windows XP SP2 and in later versions, Windows Security Center  
| uses a two-tiered approach for detection status. One tier is manual,

Re: Virens scanner und Tipps gesucht

| and the other tier is automatic through Windows Management  
| Instrumentation (WMI). In manual detection mode, Windows Security  
| Center searches for registry keys and files that are provided to  
| Microsoft by independent software manufacturers. These registry keys  
| and files let Windows Security Center detect the status of independent  
| software. In WMI mode, software manufacturers determine their own  
| product status and report that status back to Windows Security Center  
| through a WMI provider. In both modes, Windows Security Center tries  
| to determine whether the following is true:

- | . An antivirus program is present.
- | . The antivirus signatures are up to date.
- | . Real-time scanning or on-access scanning is turned on for antivirus  
| programs.
- | . For firewalls, Windows Security Center detects whether a third-party  
| firewall is installed and whether the firewall is turned on or not.

| In Windows Vista, Windows Security center no longer uses the manual  
| detection mode. All third-party products report their states into WMI.  
| In addition, in Windows Vista Windows Security Center also determines  
| whether the following is true:

- | . An antispymware program is present.
- | . The antispymware signatures are up to date.
