Hi Everyone!

We use software products of Microsoft (windows2000 server, Exchange 2000 server, ISA 2000server...) for our LAN. There's a proxy server with ISA 2000 server in the LAN to control access to Internet. Some computers in LAN, which often connect to Internet, have proxy settings in Internet Explorer (IE \Tools\internet option\connections\LAN settings\Proxy server address : Internet; port : 8080.)

Recently we installed Microsoft Exchange Instant Messaging Service for our LAN. Computers, which don't have proxy setting in Internet Explorer can log in the Instant Messaging service and normally exchange messages, but those computers, which often connect to Internet and have proxy setting in Internet Explorer, can't login the Instant Messaging service. The error appears as following : " Sock 5 proxy authentication failed. Check the Sock5 setting for username and password on the Connection Tab"

Please help me to fix the problem.

Thanks in advance

Hung.
