Hi,
Then it seems that your ISA server is configured to make IE go through the ISA server for all requests.
Check your Netowrks/Internal/Properites/Web Browser settings. It should allow direct access to your intenal network.

Regards,
Danny

Thank you for the response. Just now got some time to test this again with different security options.

1. IE Options/Connections/LAN Settings/Proxy Server points to a specific IP address and port.
2. IE Options/Advanced/Enable Integrated Windows Authentication is checked.
3. ISA requires windows authentication.

Even if I access the internal site <http://intranert> , IE prompts me for credentials.

I reset IE Security level to default for all zones – still prompts.

I set IE Security User Authentication/Logon option to "Automatic logon with current username and password" for ALL zones – still prompts.

Again, everything works fine if I have IE proxy detection set to Auto.
What else am I missing?

Thanks,
Leonid

Hi,

Re: Integrated authentication and IE proxy settings

This behavior is governed by the security settings of IE.

IE by default will not provide integrated authentication to sites that are not local. For this IE assumes that if the name includes a dot (.) then it is external and won't do integrated authentication.

On the other hand, once the automatic detection is configured then the script tells IE which sites are internal.

You can control these settings in IE/Options/Security and also in the Advance settings.

Hello,

I'm investigating how to connect our application to the external website from the network with ISA configured as proxy with the authentication mode= Integrated and "Require all user to authenticate" checked. I tested my configuration from the Internet Explorer.

1. If "Automatically detect setting" option is checked on the internet options dialog in IE, then the browser connects to external sites without any problem. In the ISA log I can see that my requests went through and were authenticated under my domain user name.

2. If I uncheck "Automatically detect setting" and check "Use a proxy server .." option, and provide the server name in the text box, then whenever I try to access internet, IE prompts me for my user name/password. ISA log shows attempts to anonymously

Re: Integrated authentication and IE proxy settings

access external
website.

My question is – why the behavior is so different for these
two options
in the IE? Why it is asking me for credentials if I explicitly
set the
proxy server?

Thank you,
Leonid.
