I would like to do something a little unusual, I would like for many users to connect to my server from the Internet and it serve up another site, but the second site is not local.

Explanation: I want many users to hit <http://mysiteA.com> and get the results from <http://mysiteB.com> which is not local. All my users/clients need to appear from one IP the, "mysiteA.com", to the other server mysiteB.com. In short, on want it to work much like an Anonymizer, but for just one web site and for just one URL. Anyone know if that's possible.

.
