Hi,

I have installed a ISA2004 server with two NIC cards and has setup rules for the users to access the internet. I have applied group policies to force the users to browse the web through proxy. Now we have a problem when users are trying to logon to Exchange IM server and was getting an error message "Socks 5 proxy authentication failed. Check the socks 5 settings for username and password on the connection tab". I have tried to provide the domain login credentials and was not successful.

For the above situation the internet access rule was configured in such a way that only users with domain auth can use the ISA as a resource to access the internet.

For a work around i have configured a rule to allow unauthenticated access to the IM website.

Can anyone has faced such situation.

Let me know your suggestions.

Thanks & Regards,
Naveen Kollipara.
