Hi

I installed some updates last night on our ISA 2004 server. The 2 updates were .NET framework and a windows 2003 security update. After the install I lost all of our VPN connectivity. Strangely enough the web proxy and firewall clients still work ok. I've tried a repair using add/remove programs and even removed .NET 2 on the server.

.. There are no errors in the windows event log.

.. When I select monitoring and click on the dashboard I get the following error "Refresh failed You do not have the necessary permissions to perform this action" The sessions pannel has a red cross next to firewall client, web proxy and total. Each red cross has "???" next to it for the number of sessions.

.. If i go into logging and click start query I get the following error message "The query stopped because an error occurred while it was running"

Does anyone have any ideas?

Many thanks

Jonny
