Hi Shijaz,

I want to migrate everything to the new hardware. Also kindly tell me what will be the difference if i create a new array for the new hardware.

Hi,

From your first post, I assumed that you are already having CSS and ISA Services on the same machine.

I suggested this since you want to replicate the same scenario on new hardware. However, only now I understand that CSS and ISA services are currently on separate h/w.

Dear Shijaz,

Thanks for your reply. But i am wondering why CSS and ISA Server services should be on the same server. Microsoft recommends to keep CSS on a different server than your ISA server. Also how would i have the same policies and rules running on the existing standalone ISA server to the 2 new NLB ISA

Hi,

You can install ISA 2004 EE on the new hardware and choose it to be part of your array. During installation, choose to install both the CSS and the ISA Services on the servers that you require to have the Config storage.

Once this is done, you can uninstall ISA on the servers that you want to phase out.

Dear All,

I want to migrate my current ISA2004 server to another better hardware. The current ISA Server is used along with 1 backend server and 1 front end server in my exchange environment. I also have CSS installed on 2 different servers for ISA.

The 2 new ISA server will be installed in an ARRAY configuration in the perimeter network.

Can someone help me on how to do this migration to another hardware. Any resource or tips.

Please help
