As stated in the error, you can't use LDAP for access rules.
If you want to authenticate internal accounts fro access rules, RADIUS is your only non-Windows option.

Thanks Jim! I unchecked that box (trust me, it's easier than dealing with the network boys!)

I was able to create my user set with the <domain>\<group> I want to use, but when I try to add them to the access rule I get the following: "The authentication method (LDAP) selected for user set <user set> is not valid for an access rule. The rule cannot be saved until you change the authentication method of select a different user set."

"Use Global Catalog box is checked" – this means that you need TCP:3268 open through the firewall; not TCP:389.
