The workstation you are doing this from needs to be a Domain member or at least have a workgroup name that matches the Netbios version of the Domain name.

WINS is pretty much required. It should be in the config of the Dialup Connectoid.

Netbios over TCP/IP probably should be enabled and allowed.

You may need to watch the ISA Monitoring log (Source Network = VPN Clients) and look for other things that are being denied and make a judgment as to if they should be allowed.

Typically what you want isn't worth doing. It is a hassle to get working,..can be undependable even when it works,..and bogs down the Slow Link (VPN) with a bunch of bandwidth eating traffic that was never designed to function over anything slower than a 10mbps full Ethernet connection. Microsoft Network Browsing (the over all name of what you are wanting) is a LAN technology, not a WAN technology.
