

microsoft.public.isa.publishing: Different domain names should map to different virtual diretory

Different domain names should map to different virtual diretory

I have two domain names registered at public DNS servers, both pointing to same IP address. I have created two different virtual directories in IIS6, containing different contents. When external users type the domain name, it should automatically redirected to the appropriate virtual folders.

Should I do this configuration in ISA or IIS? How?

TIA

J Justin
