Tony,

Do you think a tri-homed server with two of the adapters in the LAT, then using client address sets of the extranet user(s) for filtering may work? Then it seems you could lock the users down with enough rules. Either way, the firewall seems pointless, as there would be so many possibilities for intrusion. Maybe another proxy only product. Seems a much better configuration would be a VPN, don't you agree? Then you could control them exactly like they are on the internal network (cause they are!), and control the routing as well. Then strong authentication, certificates and all kinds of boundaries could be placed on them.. The routing and remote access snapin for W2K is strong.. SrChasJC
