

I can't make ISA 2004 let me access the Internet

I understand I would need to create an "Access Rule" if I want to access the Internet from ISA 2004 Server itself.

I go to "firewall", I create an access rule:
This rule applies to : "all outbound traffic"
from: "Local host"
To: "External"

Then I launch Internet explore and it returns "page cannot be found". Also, if I try to ping 66.94.230.49 (what it is yahoo.com), ping times out. In my view since I allowed all "outbound" protocol, icmp ping should work, right ? What I am missing here ?
