Hi,

Thank you for posting.

Based on your description, my understanding of your network structure is as following:

LCS 2005 – ISA 2004 (front) – DMZ (Access Proxy) – ISA 2004 (front) – Network A – Internet

You had published the SIP on the ISA 2004 (front) server and a client computer located in the Network A can connect to the Access Proxy without any problems.

This issue is when a client computer connect to from Internet is a VoIP NATed client, the Voice Communication cannot work.

Since the client computer located in the Network A can use LCS correctly, it means the configuration in ISA is correctly.

There is no problem regarding the ISA part at all.

If the VoIP NATed client cannot connect correctly, you will need to verify the your networking between the ISA and the client computers.

To this issue, I recommend you to check it with your ISP and the client users to check how the connection was made.

Something between the ISA server and client computers block the connection to the 5601 port that you had published.

Have a nice day!

Sincerely,

Lee Li
