Hi Rockfire,

I would like to allow my SNAT clients to hopster application .
But , I don't know what ports (and include secondary
channel)that the
hopster used . So , how can I configure in my ISA server for
this issue
?

www.hopster.com:

"friendly. download, install, done. no configuration hassles, no
techie-talk or geek-speak. not only does hopster configure itself, it
even knows how to configure MSN Messenger, Trillian, Yahoo and many
others - so you don't need to. Once installed, hopster operates silently
in the background, you won't even notice it's there."

<http://www.hopster.com/help/>

Seems, that you've to use ISA as a socks Proxy. Configure hopster to use
ISA as a Socks 4 Proxy Server and enable Socks-Support on ISA.

Regards,
Dieter
