Hello !

I have a problem that a tried to solve but without any success.

I have Cisco PIX as front firewall. Isa installed in DMZ. FE on internal network. 443 is allowed between internet-> DMZ -> internal. I am using a certificate from verisign (the same on FE and ISA listener). I have a web publishing rule. The ISA in Single adapter mode.

When I connect from Internet to ISA i get (forms based), i have selected our internal domain name in the listener. FE is set to only allow Basic authentication. In user i set only authenticated user and forward basic..

I get det login (from internet) but it denies me all the time i have logged this

12229 The server requires authorization to fulfill the request. Access to the Web server is denied.

12210 An Internet Server API (ISAPI) filter has finished handling the request.

I am using isa 2004 enterprise. I would be very HAPPY if this is solved.
