Hi , I'm running ISA in a Windows 2000 server. Most of our client are using Windows XP Pro (SP2) and they're using Proxy to access internet/MSN which is working fine. The problem is with one of our Client which is Using a Machintosh, he could access internet through the Proxy server but he can't use MSN Messenger. I've tried to configure the MSN for that MAC but the "HTTP Proxy" configuration part is only allowing me to enter the username (for the Proxy Server) it is not allowing me to enter the password (the password box is greyed/disabled). I've checked the Socks 5 and Socks V4 configuration options on the MAC's MSN and it allows me to enter the username and password there. How do i enable Socks 5 or Socks 4 for this user, can i configure it through ISA ?

Please help.

Thanking you in Advance
