Ok, so I set my allow rule to apply to "domain users". I don't see an "authenticated users" when I go to add a user or group. Once I did that, I took out the "all users" and tried to access google. It popped up and asked me for a username and pw again. Once I entered my domain credentials, it took me to my access denied page. as I said, I did this on my allow rule which will basically allow you to get to any site that i didn't define in the deny rule that runs 1st. My allow rule is 2nd.

as "anonymous", which means you never get any "username". Stop using "All Users" for anything you do, unless you specifically don't care to know who the user is.

If you want to tell it to effect "everybody" and yet still give user account information, try using the "Authenticated Users" Group that is in Active Directory instead of "All Users". The "All Users" is just an internal thing within ISA.
