Unfortunately, you're creating a conflicting set of requirements:

1. "some of our staff" – implies that ISA should make this decision based on the user's credentials
2. "do not want to install MS Firewall Client" – means that ISA needs to make this decision without having access to the user's credentials

We are running a Windows 2000 Server (Domain Controller) that has ISA 2000, Exchange 2000 installed. This machine has two NIC interfaces; one connecting to the LAN, the other connecting into a CISCO 1605 Router – for Internet ACCESS.

I would like some of our staff to be able to access external emails (SMTP / POP3) from certain service providers, ie Yahoo UK, Hotmail etc. I do not want to install MS Firewall Client on their machines. What steps would I need to take in order to be able to do this (bearing in mind that i have two NIC interfaces on the server; one for the LAN, one with a PUBLIC IP address)?

Thanks

.
