

Multiple external IPs, binding on outbound

Source: <http://www.tech-archive.net/Archive/ISA/microsoft.public.isaserver/2007-09/msg00041.html>

Hi all

My ISA server has a hoard of external IPs. Amongst them are 4 for mail servers and 2 for Radius servers. Inbound works ok, but outbound always binds to the primary external IP. There have been suggestions to change the primary IP to the IP of the mail server, but in our case we have multiple servers so this is not possible.

For mail it is not too much of a problem, except for those mail servers using reverse lookups to identify spam.

For Radius it is a problem. Our upstream provider will only accept Radius Packets of Disconnect (PoD) from our Radius server IPs it knows. As ISA is using the primary external IP all our PoDs are being rejected.

Is there any way of binding outbound traffic to a specific external IP?

If not, please consider this 'feature' of ISA useless and in the next service pack please provide a way to publish outbound traffic similar to inbound so that we can bind our services to the correct external IPs.

Thanks

Tim Parker-Nance
